1 Abstract:

[1]

The first source I would like to cite is a post from the website Guru99. It details the similarities and differences between the MVC and MVVM architectural patterns for programming as well as their respective pros and cons. Previously in iOS programming, MVC (Model-ViewController) pattern was the recommended framework for designing your projects in XCode. However, now Apple is advising developers to adapt to the MVVM(Mode-View-ViewModel) framework instead.

2 Abstract:

[2]

The second source I would like to cite is an article from techopedia that details the topic of ubiquitous computing. Ubiquitous computing is the idea of having many devices with various purposes working together to make our lives easier. The paper delves into the key features of ubiquitous computing as well as it's purpose.
